Install media don't boot in UEFI mode on certain motherboards

#f36 #f38 #f37 #f39 #grub #boot #uefi

Kamil Páral  **kparal** Proven Tester

Sep 15

Problem

Fedora 37, 38 and 39 install media don't boot on certain motherboards. You might see an error similar to the following (or none at all):

```
Invalid image
Failed to read header: Unsupported
Failed to load image: Unsupported
start_image() returned Unsupported
```

Cause

A problem was identified and fixed in *shim*, an initial UEFI bootloader. Unfortunately, due to a difficult certification process for this component, the fix isn't present on specified install media.

Workarounds

If you're affected, several workarounds exist:

- **Option A)** Install Fedora 36 and upgrade.
- **Option B)** Switch your motherboard to BIOS mode instead of UEFI and install an affected Fedora release this way.
- **Option C)** If you really insist on booting an affected Fedora release install media in UEFI mode and you're a *power user*, then you can do the following:
 1. Burn the affected Fedora release live media to a UFSR flash drive

Get Fedora Linux Fedora Documentation About the Fedora Project Code of Conduct
Privacy Statement

Install media release live media to a USB flash drive.
and partition from the flash drive, which is the **ESP** (10 MB size, FAT
It's your OS.

3. Remove **EFI/BOOT/BOOTX64.EFI** from that partition. Also remove **EFI/BOOT**
/BOOTIA32.EFI and **EFI/BOOT/grubia32.efi**, in order to make more space
available (these files shouldn't be needed).

4. Download [**shim-x64-15.4-5.x86_64**](#), extract it, and find **boot/efi/EFI/BOOT**
/BOOTX64.EFI in it.

5. Copy the **BOOTX64.EFI** from the extracted RPM into the original location
EFI/BOOT/ on the mounted ESP.

6. The flash drive should now boot in UEFI mode on your system. Skip the media
verification process during boot, it's expected to fail (you've modified the install
image).
